

USM

The Haller C lock was developed in collaboration with USM. It is the revolutionary, electronic alternative to the existing mechanical lock from USM, retrofittable and cloud-based.

One journey of many

For over 50 years, we have been supporting leading manufacturers in the development of their individual safety solutions that make everyday life easier with safety. From the initial ideas to the ready-to-sell product, we are at your side with help and advice. Let us merge your ideas with our expertise.

Broad specialist knowledge, decades of experience and a wide range of technical options, including for the new networked world with app, software and cloud solutions, are available to you.

Customers with individual solutions:

Mietra

Developed for the most critical audience: Children. The ultra-rugged Combipad lock started out as a standard product and was then customized for the school locker provider Mietra. Upgrades in the firmware and the circuit board found their place.

Dare new

You have an idea - we turn it into a marketable product. As a development partner, BURG supports companies in developing individual solutions that are precisely tailored to their requirements and markets.

Our specialty: the development of customer-specific locking systems and security solutions. Whether it's an initial sketch, a specific requirement or a rough request - we get involved in the process at an early stage and accompany you through all process steps: From brainstorming and technical conception through to series production. Our interdisciplinary teams work closely with you: strategically, creatively and practically.

In our in-house development department, visions are turned into functional, economically viable products - tailored to your area of application. We think along with you, develop ahead and keep an eye on practicability, costs and time frames.

Let us develop your individual dream lock together.

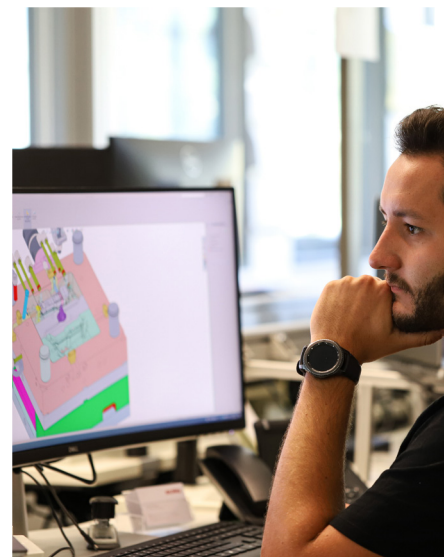

Step 1 Trust

Before we dive into concepts and developments, we first need to get to know each other and exchange ideas. Entering into a partnership goes hand in hand with mutual trust.

Step 2 Orientation

Initial approaches for the product are developed. In workshops, we identify potential, review existing resources and incorporate current market trends and technologies. This is how we create the basis for innovation.

Step 3 Concept

A clear concept with all technical and functional requirements is created. This includes specifications, practicability studies and initial prototypes. The goal: a realizable and market-oriented solution.

Step 4 Realization

The product takes shape: We develop all components and parts, as well as the necessary tools. A particular focus is on modern technology such as app, software and cloud solutions for electronic locking systems.

Step 5 Production

From prototypes through correction phases to production. Step by step, we develop molds and mounting solutions for an automated production process, if required, so the product can be manufactured efficiently in series.

Step 6 Finalization

Completed sampling, existing certifications and comprehensive documentation confirm the quality of the product. The preparation of instructions is also included - for a smooth market launch.
